Introduction to RStudio Server

The CCDL

The following two analysis examples are both microarray differential expression analyses.

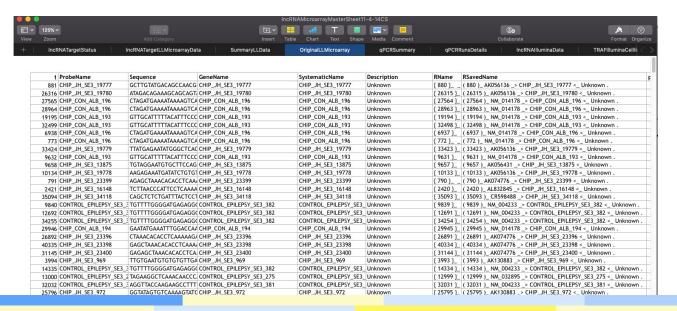

<u>Differential Analysis Example 1</u>: "100% Up to Date Analysis"

Methods Documentation: ~200 words describe the general methods in a publication. The step-by-step recount of how these data came to be were handwritten, with one copy located in a lab closet.

Data availability: The original data are on a flashdrive, in a desk drawer, in a lab. The already processed version is on <u>GEO</u>.

Project organization: Many files with various nebulous terms like "MasterSheet" and "Sorted" and "Edit" and "100% Up to Date".

Software versions: No idea what software package(s), regardless of version.

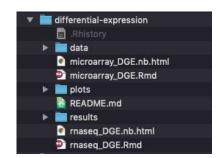

Data Analysis Example 2: "GitHubbed Analysis"

Methods Documentation: Publicly available, online notebooks show step-by-step process that can be re-run.

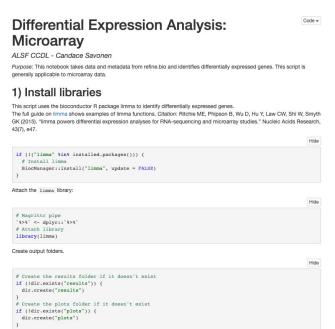

Data availability: Data that was originally used is available for download online.

Project organization: Folders labeled, most recent is present, with <u>prior versions tracked on GitHub.</u>

Software versions: Specific requirements and version numbers shown in notebook and <u>README</u>.

refine.bio Example Workflow: Differential expression

refine.bio includes both microarray and RNA-seq experiments. The methods for performing differential gene expression (DGE) analysis for each technology differ. In this module, we include simple two-group comparison examples for each.

Contents

- Microarray notebook: takes microarray data and metadata from refine.bio and identifies genes that are differentially
 expressed between two groups.
- RNA-seq notebook: takes RNA-seq data without quantile normalization from refine.bio and identifies genes that are
 differentially expressed between two groups. Read more about skipping quantile normalization here in our
 documentation.
- GenePattern differential expression analysis: GenePattern modules can be run via a GUI. To use refine.bio data with GenePattern, you will need to change the format as described in this section.

Requirements and usage

This module requires you to install the following software to run examples yourself:

- R
- RStudio for working with R Notebooks.
- Bioconductor
- tidyverse

These requirements can be installed by following the instructions at the links above. The example R Notebooks are designed to check if additional required packages are installed and will install them if they are not.

"100% Up to Date Analysis" OR "GitHubbed Analysis"

Which analysis would you...

...be more inclined to borrow the methods from?

...trust the methods of more?

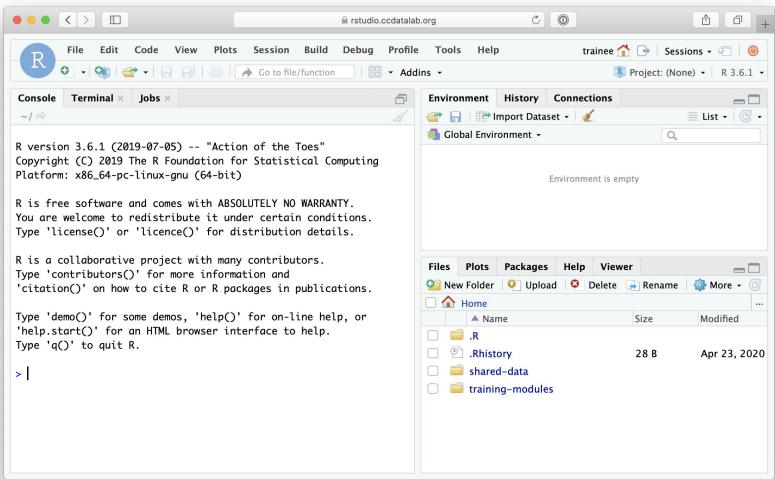

...feel would be easier to reproduce?

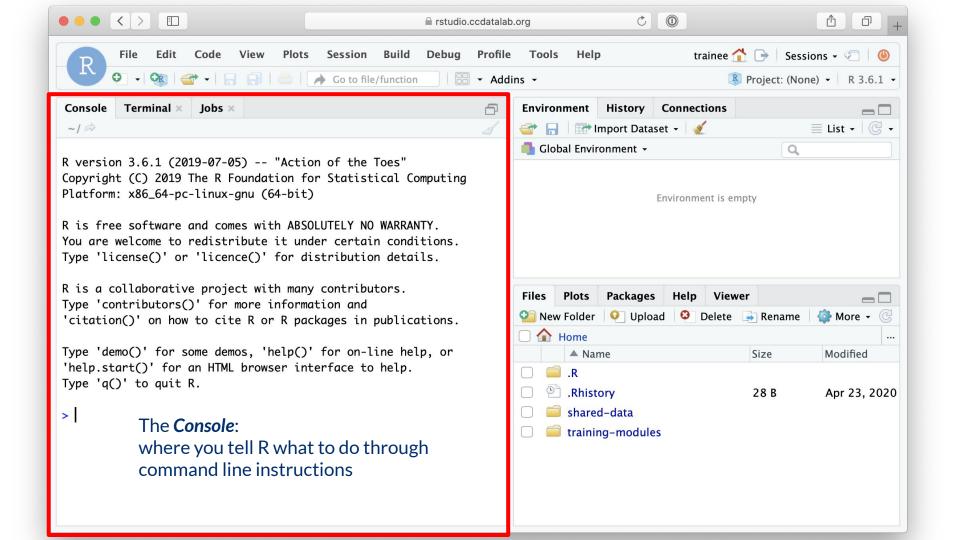

Command line vs GUI (graphics user interface)

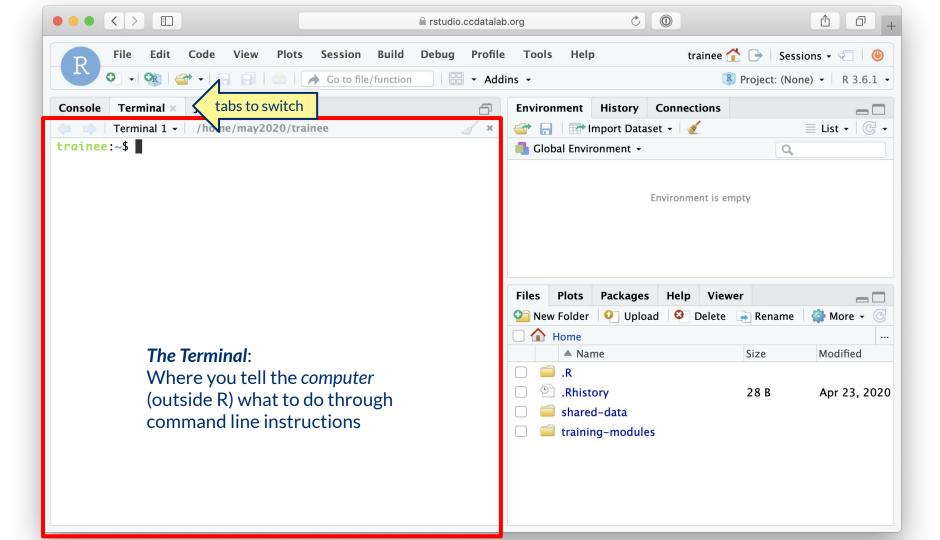

- An interface is how you interact with a program

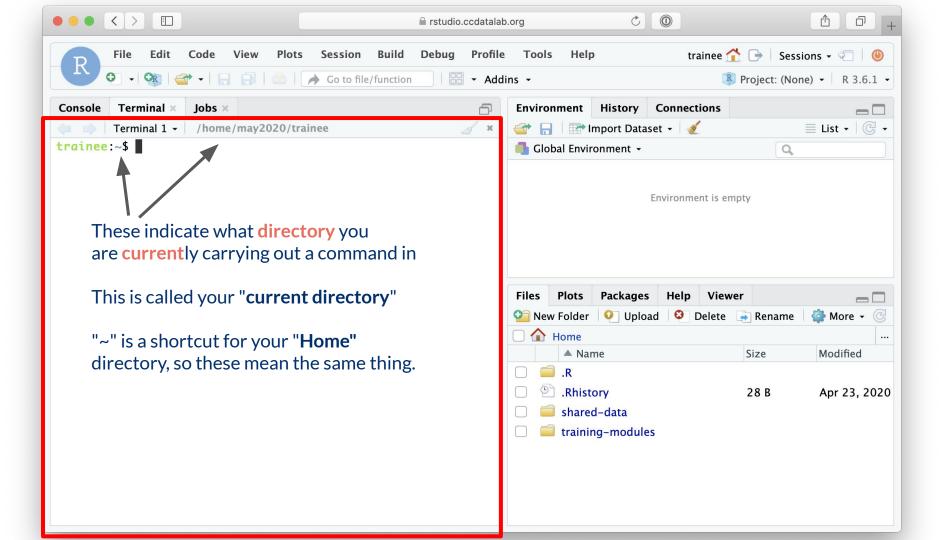

- GUI's have buttons you can click to do things,
- Command-line interfaces have you *type* out things to do them

RStudio Server: A basic guide

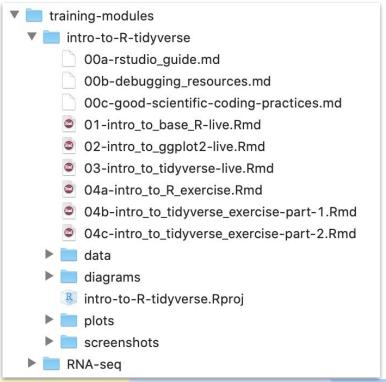

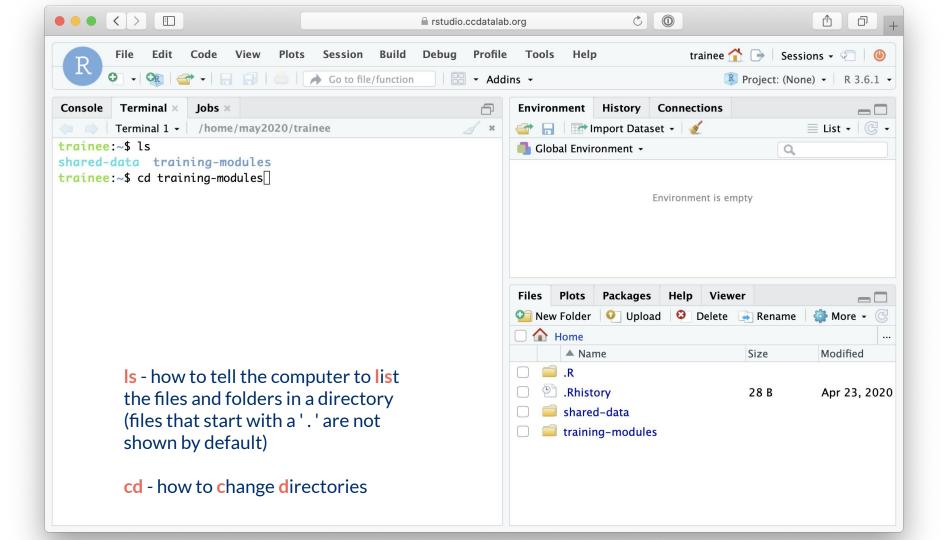

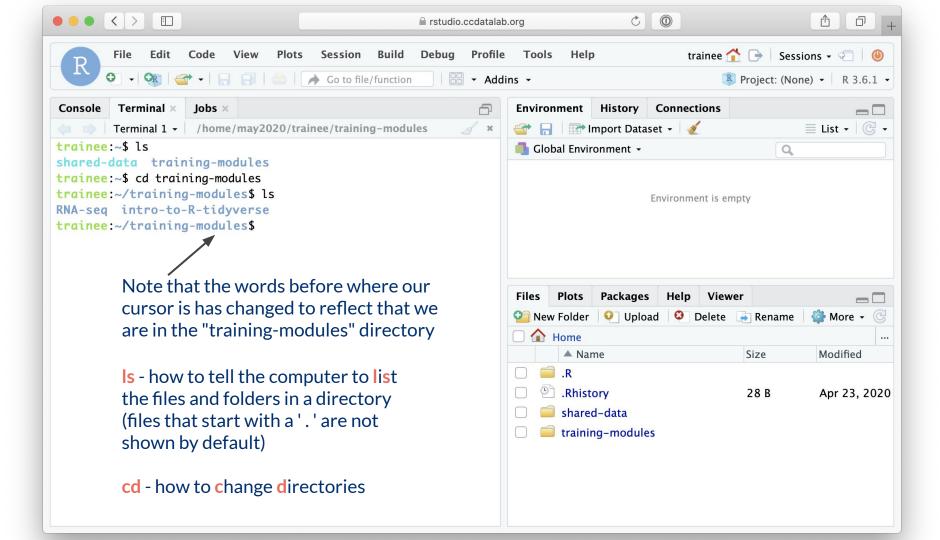

Directories = Folders

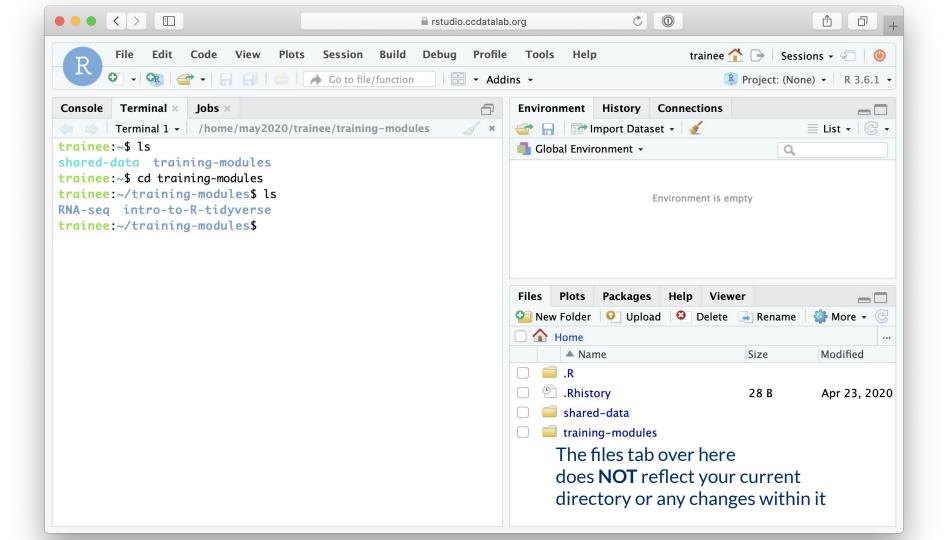

When we are doing things through command line, we have to look at where the files we

are using are being kept.

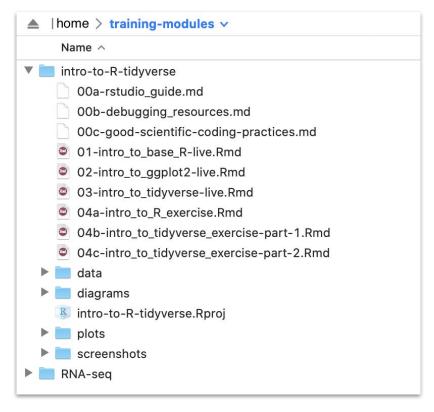

File paths: Directions to a file or folder

Let's say we want access to "01-intro_to_base_R-live.Rmd"

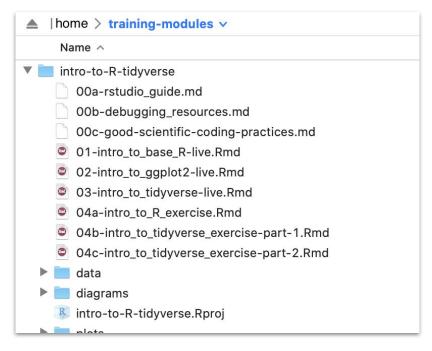

Current directory = "training-modules"

File path = "intro-to-R-tidyverse/01-intro_to_base_R-live.Rmd"

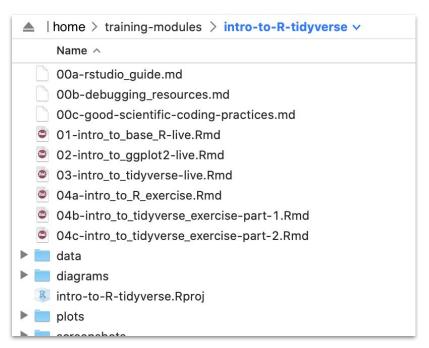

File Paths can be relative

Let's say we want access to "01-intro_to_base_R-live.Rmd"

Current directory = "training-modules"

Relative file path = "intro-to-R-tidyverse/01-intro_to_base_R-live.Rmd"

Current directory = "training-modules/intro-to-R-tidyverse"

Relative file path = "01-intro_to_base_R-live.Rmd"

Introduction to R

The CCDL

R programming

Programming: making executable scripts for accomplishing a task (in this case, data analysis is our task)

Scripts allow others to see, step-by-step, what you did.

Why we use R:

- It's free
- People make cool packages that do stuff for us
- Many researchers in genomics use it (as well as Python)

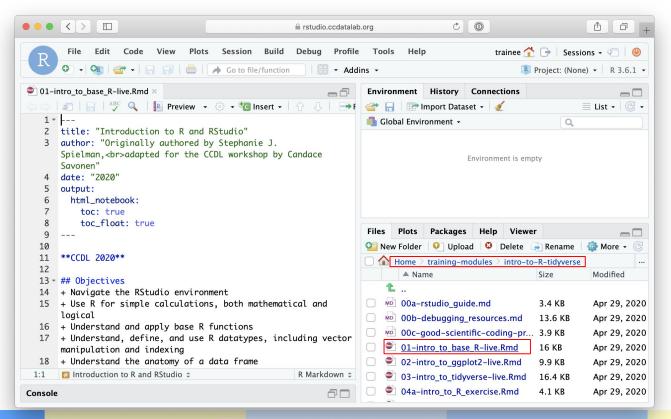

One in five genetics papers contains errors thanks to Microsoft Excel

By Jessica Boddy | Aug. 29, 2016, 1:45 PM

What you type	What you see	How Excel stores it
MARCH1	1-MAR	42430
SEPT2	2-SEP	42615

R Notebooks

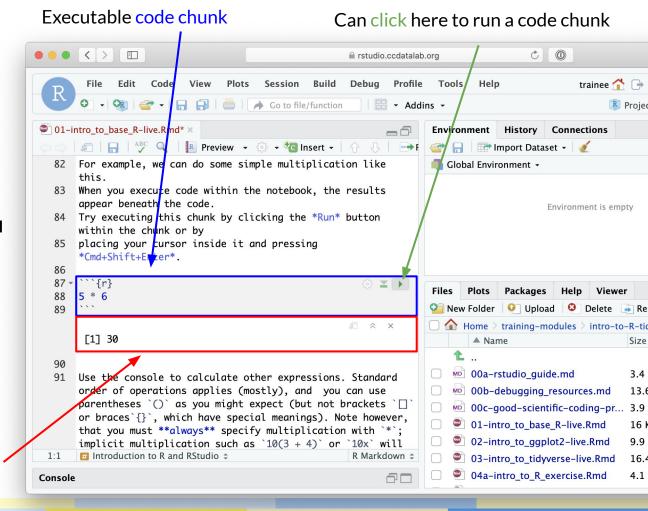

Use the "Files" tab to open: training-modules/intro-to-R-tidyverse/01-intro_to_base_R-live.Rmd

R Notebooks

 R Notebooks allow you to have files that show both your code and results

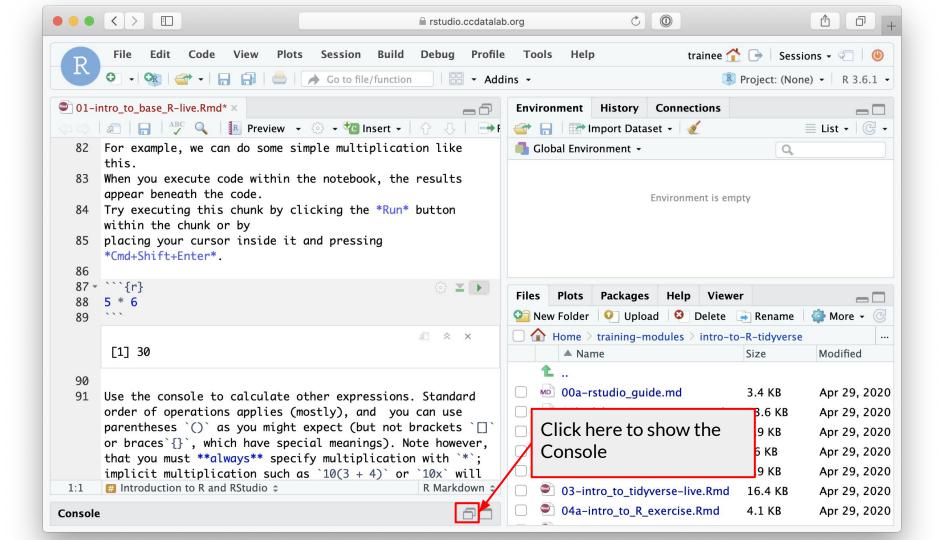

Output from above code chunk

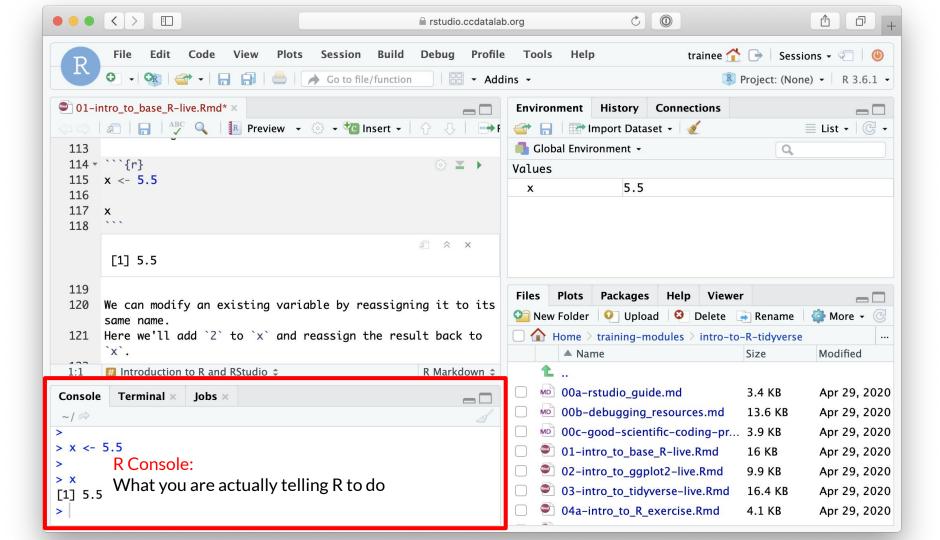

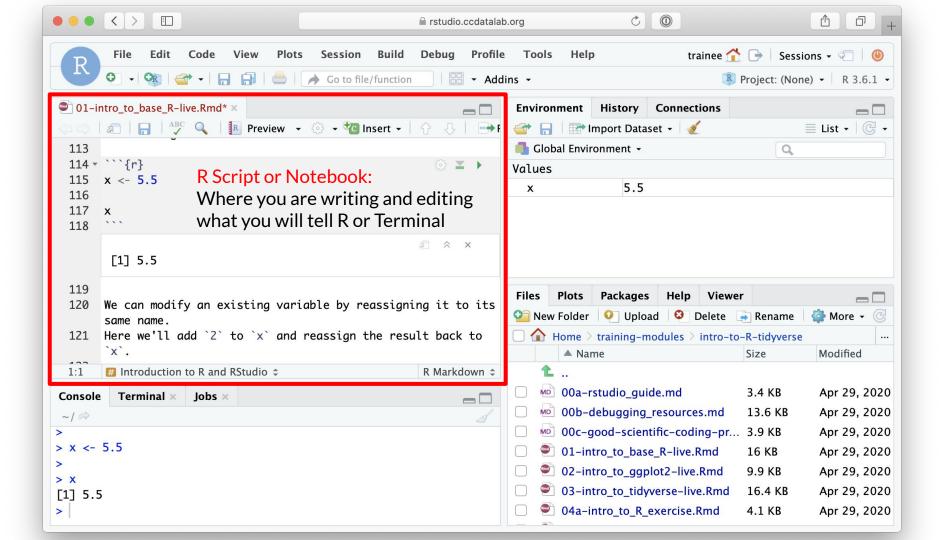

R Notebooks

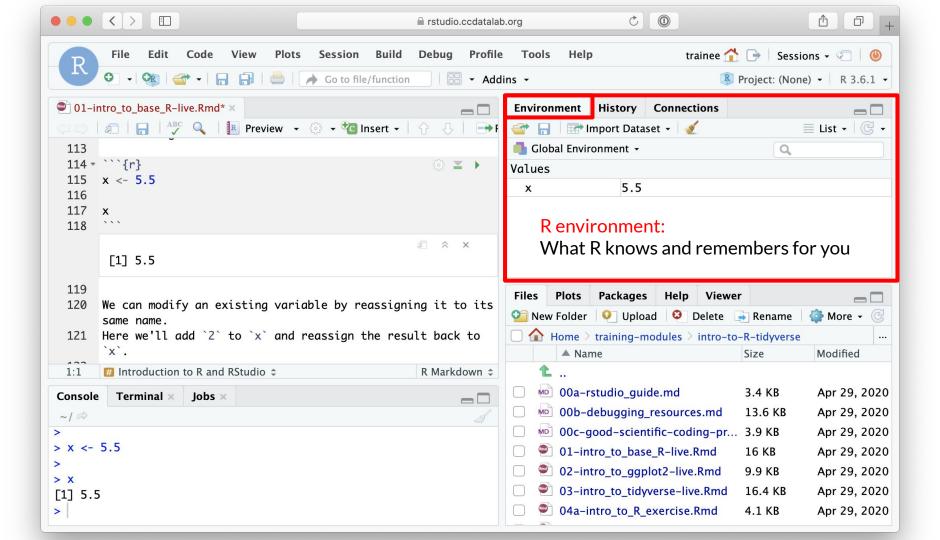

Code that runs in R
 Notebooks uses
 wherever the file is
 saved as its current
 directory

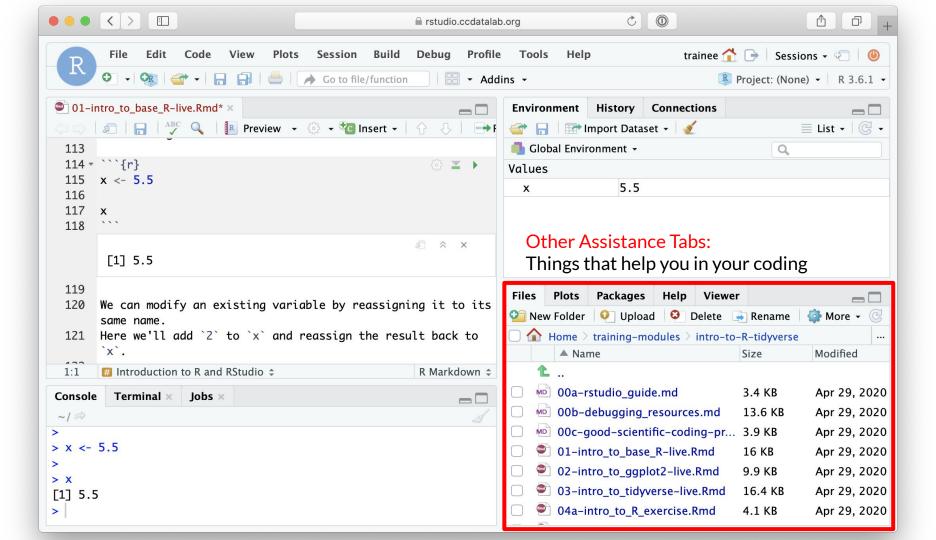

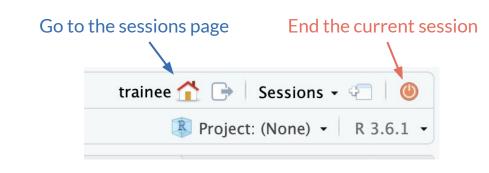

RStudio Sessions

- On the server, R run is running many times at once
 - Each user has their own "Session" running, with its own memory and processes
 - It is possible for a user to have more than one session at a time
- We will usually want to start new sessions between notebooks to keep the environment clean

Session Page
